Anion Sanitary Napkin

7 LAYERS

Layer	'Love Moon'	Other brands
Layer 1	Soft and comfortable surface with absorption which is twice stronger.	Surface of artificial fiber or rough surface of soft.
Layer 2	Anionic tape of world advanced standard and granted with national patent, can effectively get rid of the cause of female genital inflammation: anaerobic bacteria.	No such anionic tape or are using medicated tape not recommended by experts.
Layers 3 and 5	Dust-free paper after strict sterilization is used for 360-degree wrapping of the absorbent agent.	Paper pulp from recycled items with high level of chemical bleach is used as filling material, or chemical fiber materials are used.
Layer 4	Adequate absorbent agents which are colourless.	Low quantity of absorbent materials.
Layer 6	A base film which is permeable to air but not water.	Plastic film which is not air permeable.
Layer 7	Adhesive base layer used for food products.	Adhesive base layer used for industry.

Introduction to layers 3 and 5:

Many sub-standard products in the market are mostly made of paper pulp manufactured from recycled wastes. These raw materials contain high levels of lead, bacteria and microorganisms as well as abundant additives used during the re-processing stage such as industrial alkaline, bleaching powder, deodorizer, fluorescence agent and other chemicals. These are all alkaline substances that can easily lead to diseases. In healthy condition, the human skin has a pH value indicating weak acidity which has its immunity function. The many sub-standard sanitary napkin products commonly found in the market have high contents of alkaline substances that would disrupt the skin acidity, making the human physiological condition conducive for the growth of trichomonad bacteria that can destroy sperms in the vagina to cause infertility. Such patients who go to see the Chinese physicians may be asked to take Chinese herbs for years but all to no avail. If they could see experienced doctors, they would be given proper medication and asked to change to another type of sanitary napkin for two to three months to see if the situation would change.

Introduction to layer 4:

'Love Moon' sanitary napkin contains absorbent agents of high quality imported from Japan. It has the characteristics of being healthy, environment friendly and non-swelling and could enhance body immunity with its appropriate pH value.

Operation: Put the absorbent layer in the cup (the water in the cup should not be more than 100ml), and show the effect of the absorption after a few minutes; put the cup upside down to show that no water is left unabsorbed.
